How is it???

not bad

good

good but tired

**Tell me if you have problems with
practictical tasks**

Agenda

- Recall what was learned
- Look at current topic practice
- Discuss theory
- Quiz

Total Recall

What is the primary function of the Proxy Pattern?

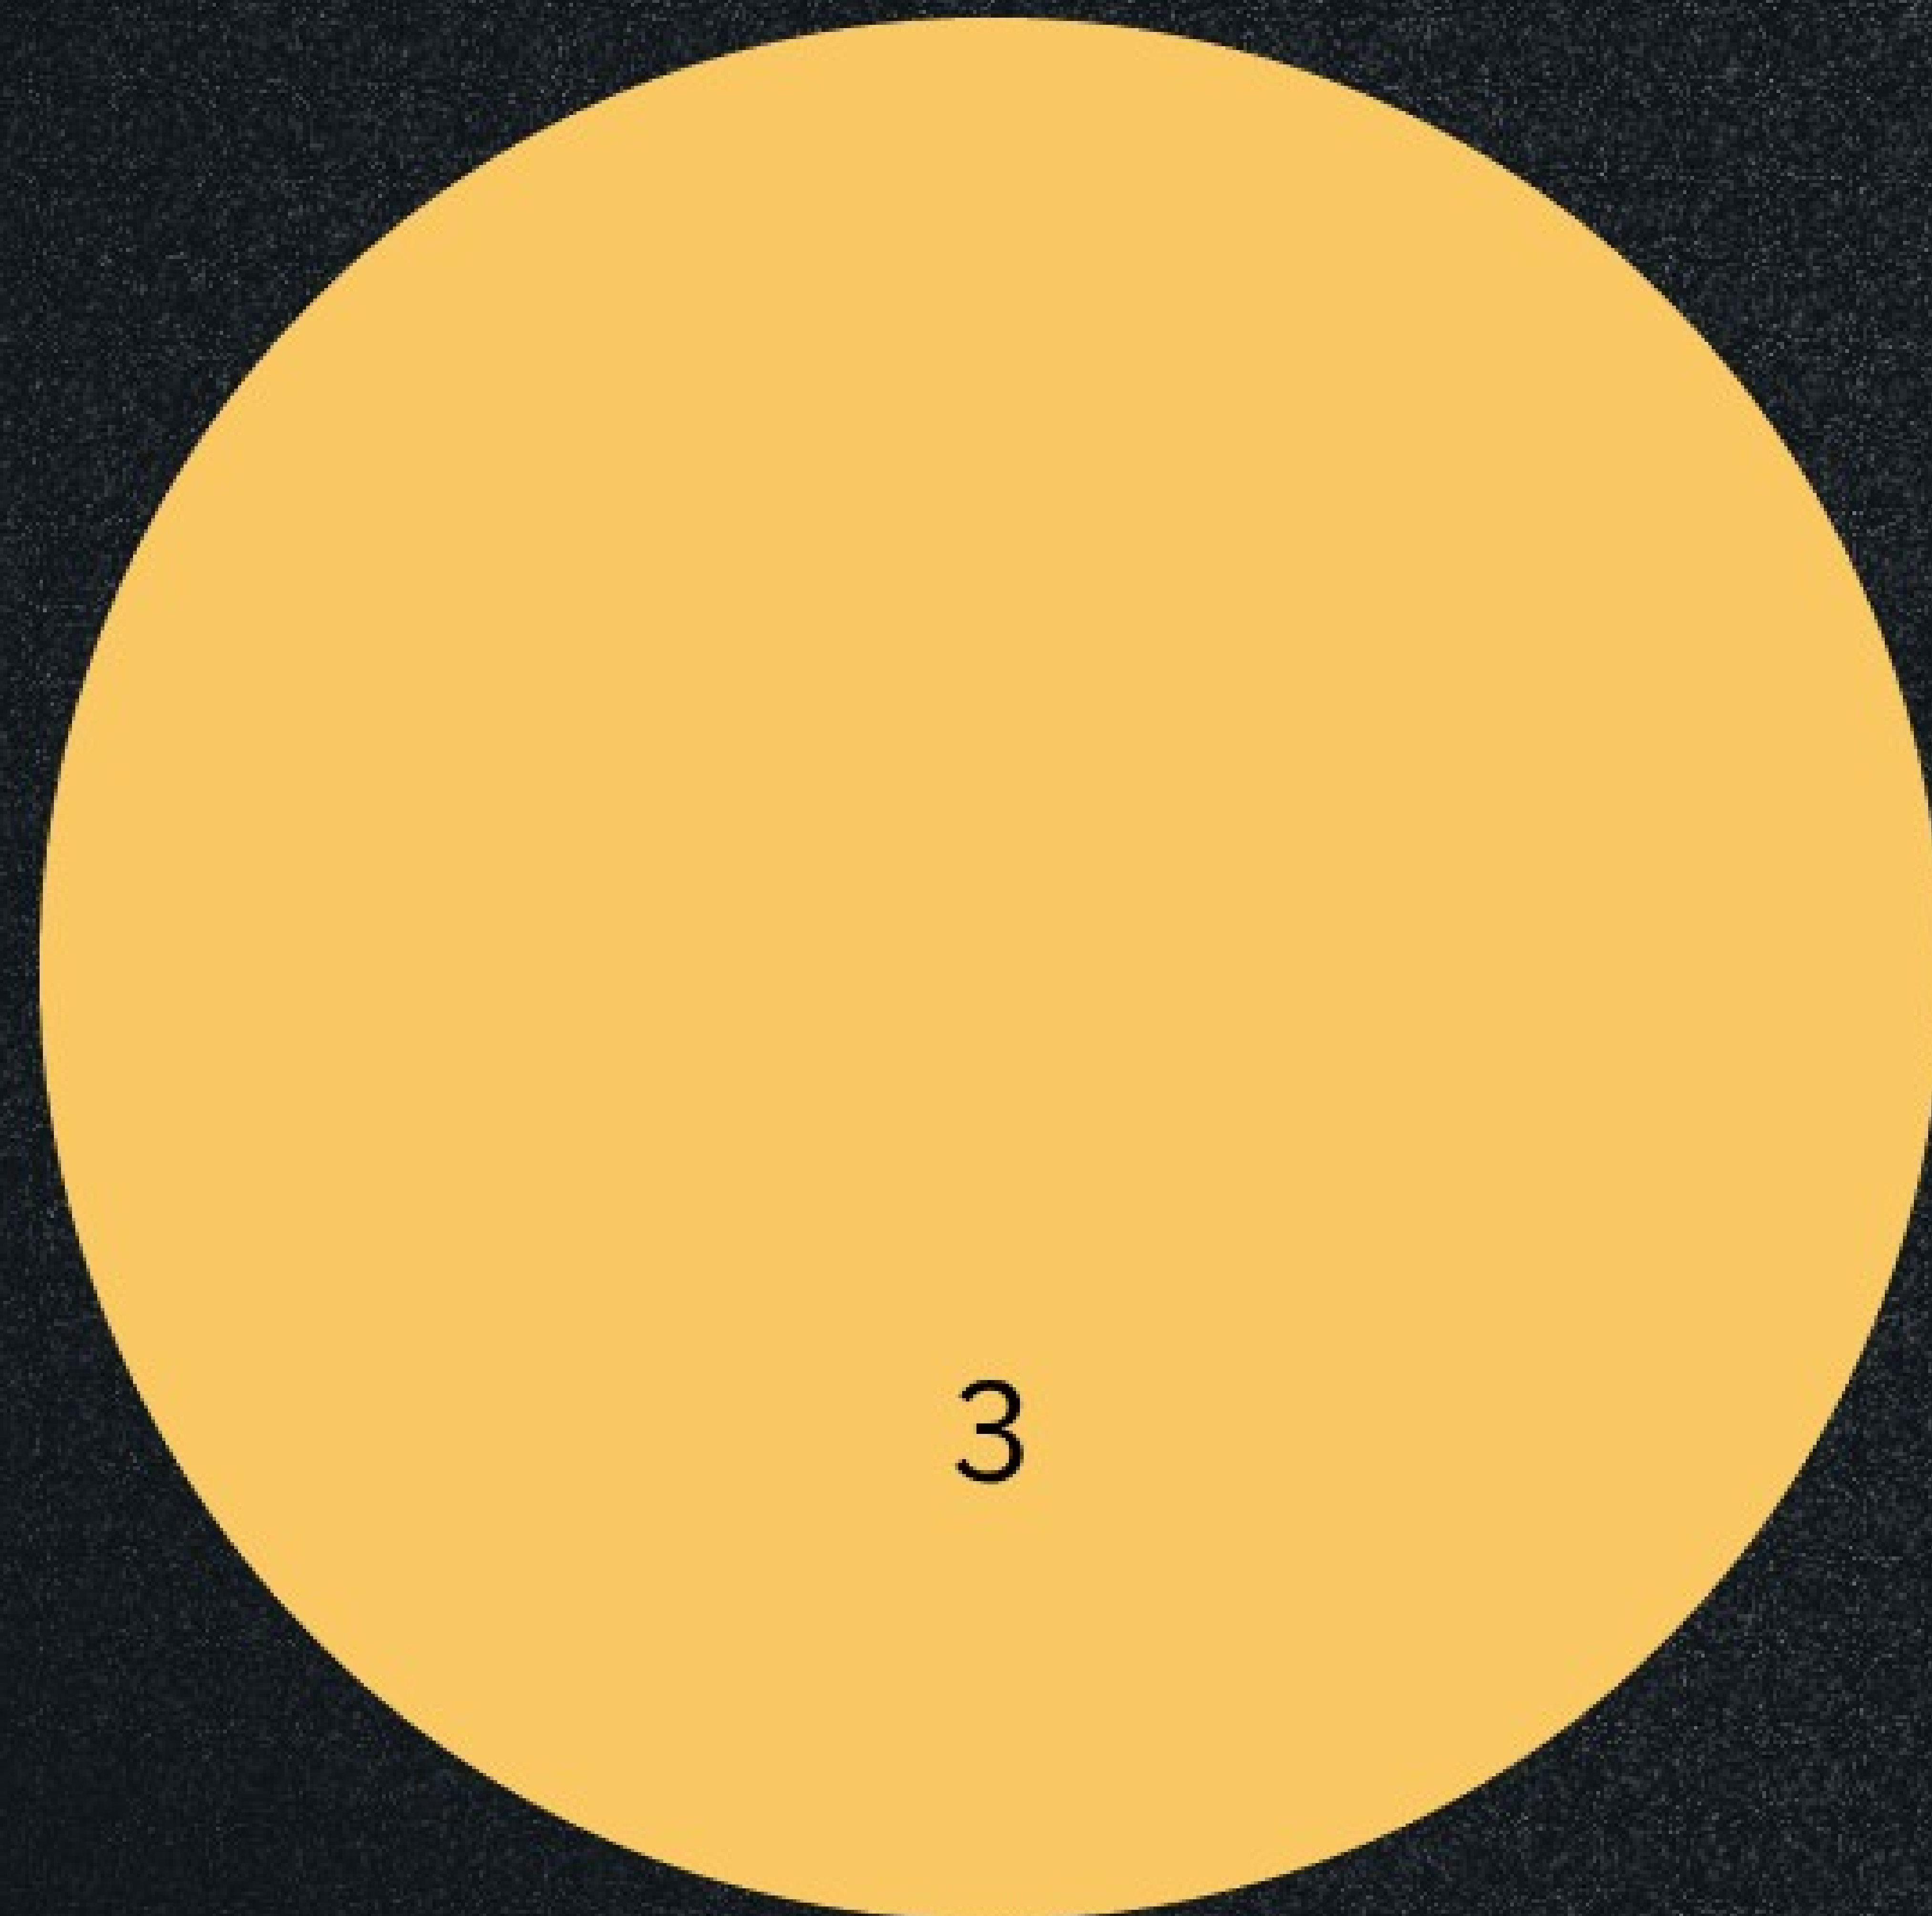

- ☐ 0 To store data for quick access later ☐
- ☐ 0 To simplify the interface of an existing object ☐
- ☒ 5 To add an intermediary layer between a client and an actual object ☒
- ☐ 0 To replace the original object with a different one ☐

What is the primary function of the Adapter design pattern in software development?

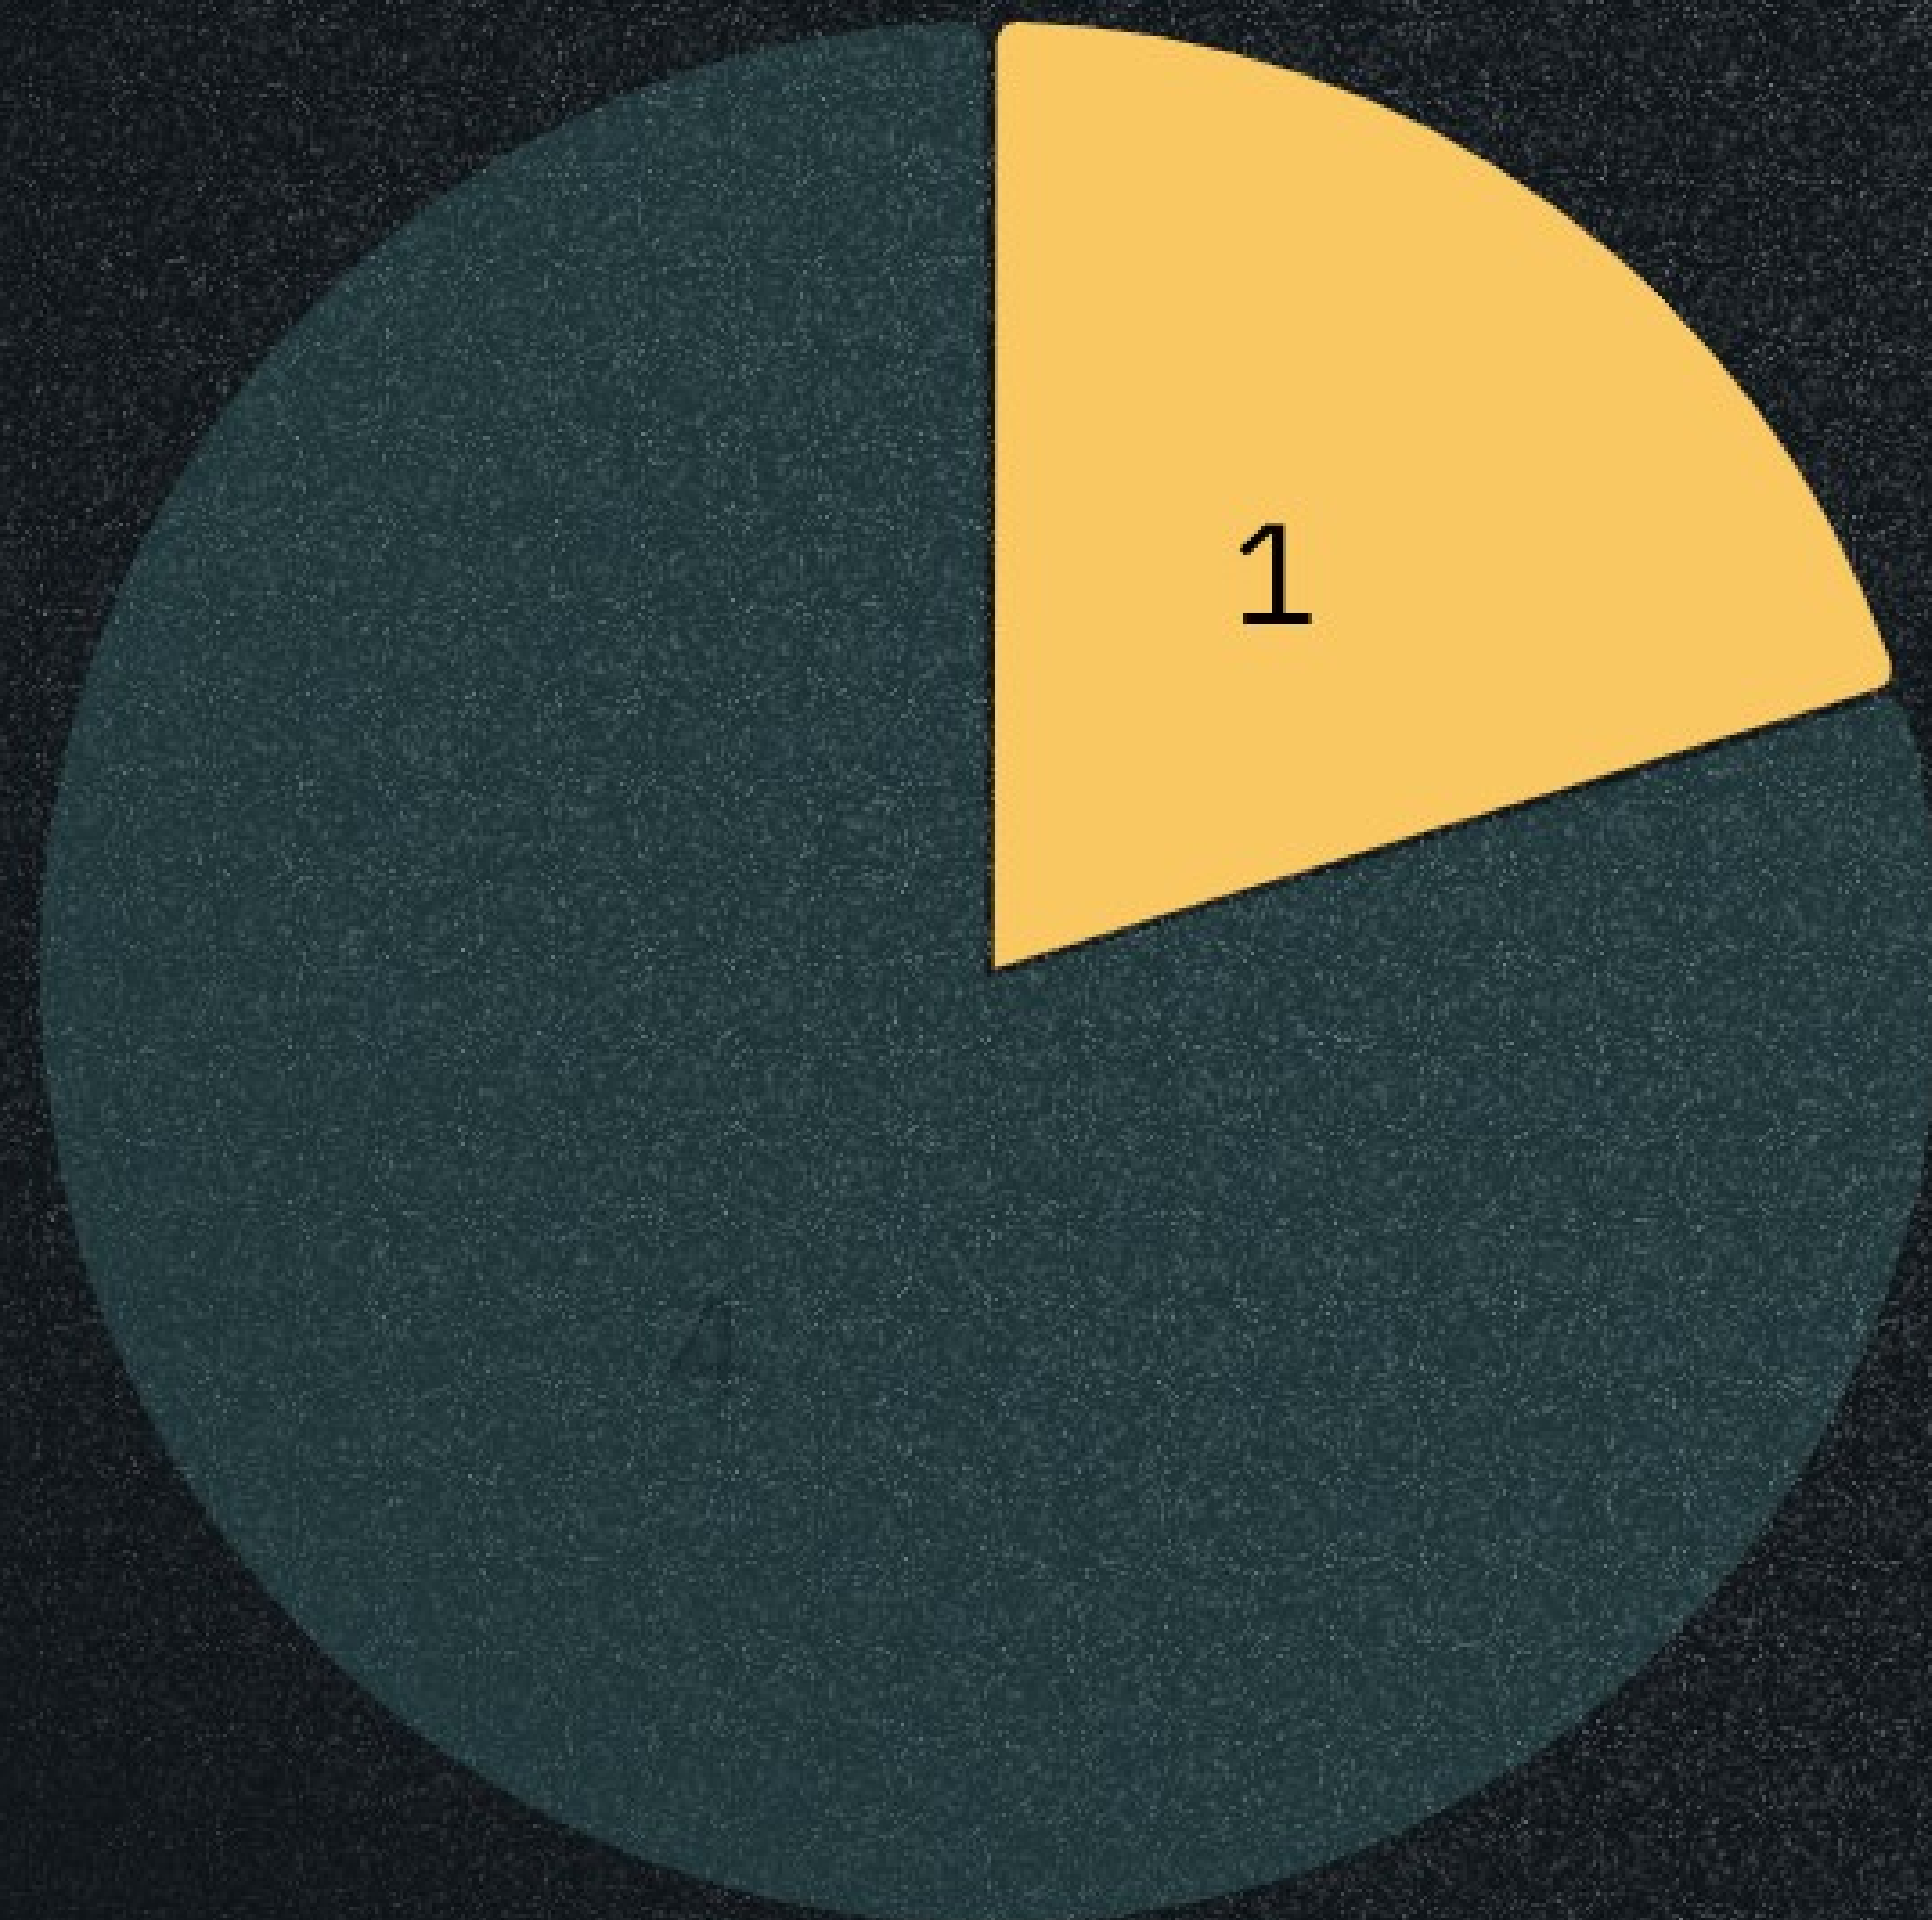

- ☒ 6 A) It allows classes with incompatible interfaces to work together by wrapping its own interface around that of an already existing class. ✓
- ☐ 0 B) It ensures that a class only has one instance and provides a global point of access to it. ✗
- ☐ 0 C) It provides an interface for creating families of related or dependent objects without specifying their concrete classes. ✗
- ☐ 0 D) It allows for the dynamic addition of new operations to objects without modifying the classes. ✗

What is the main purpose of using the Decorator?

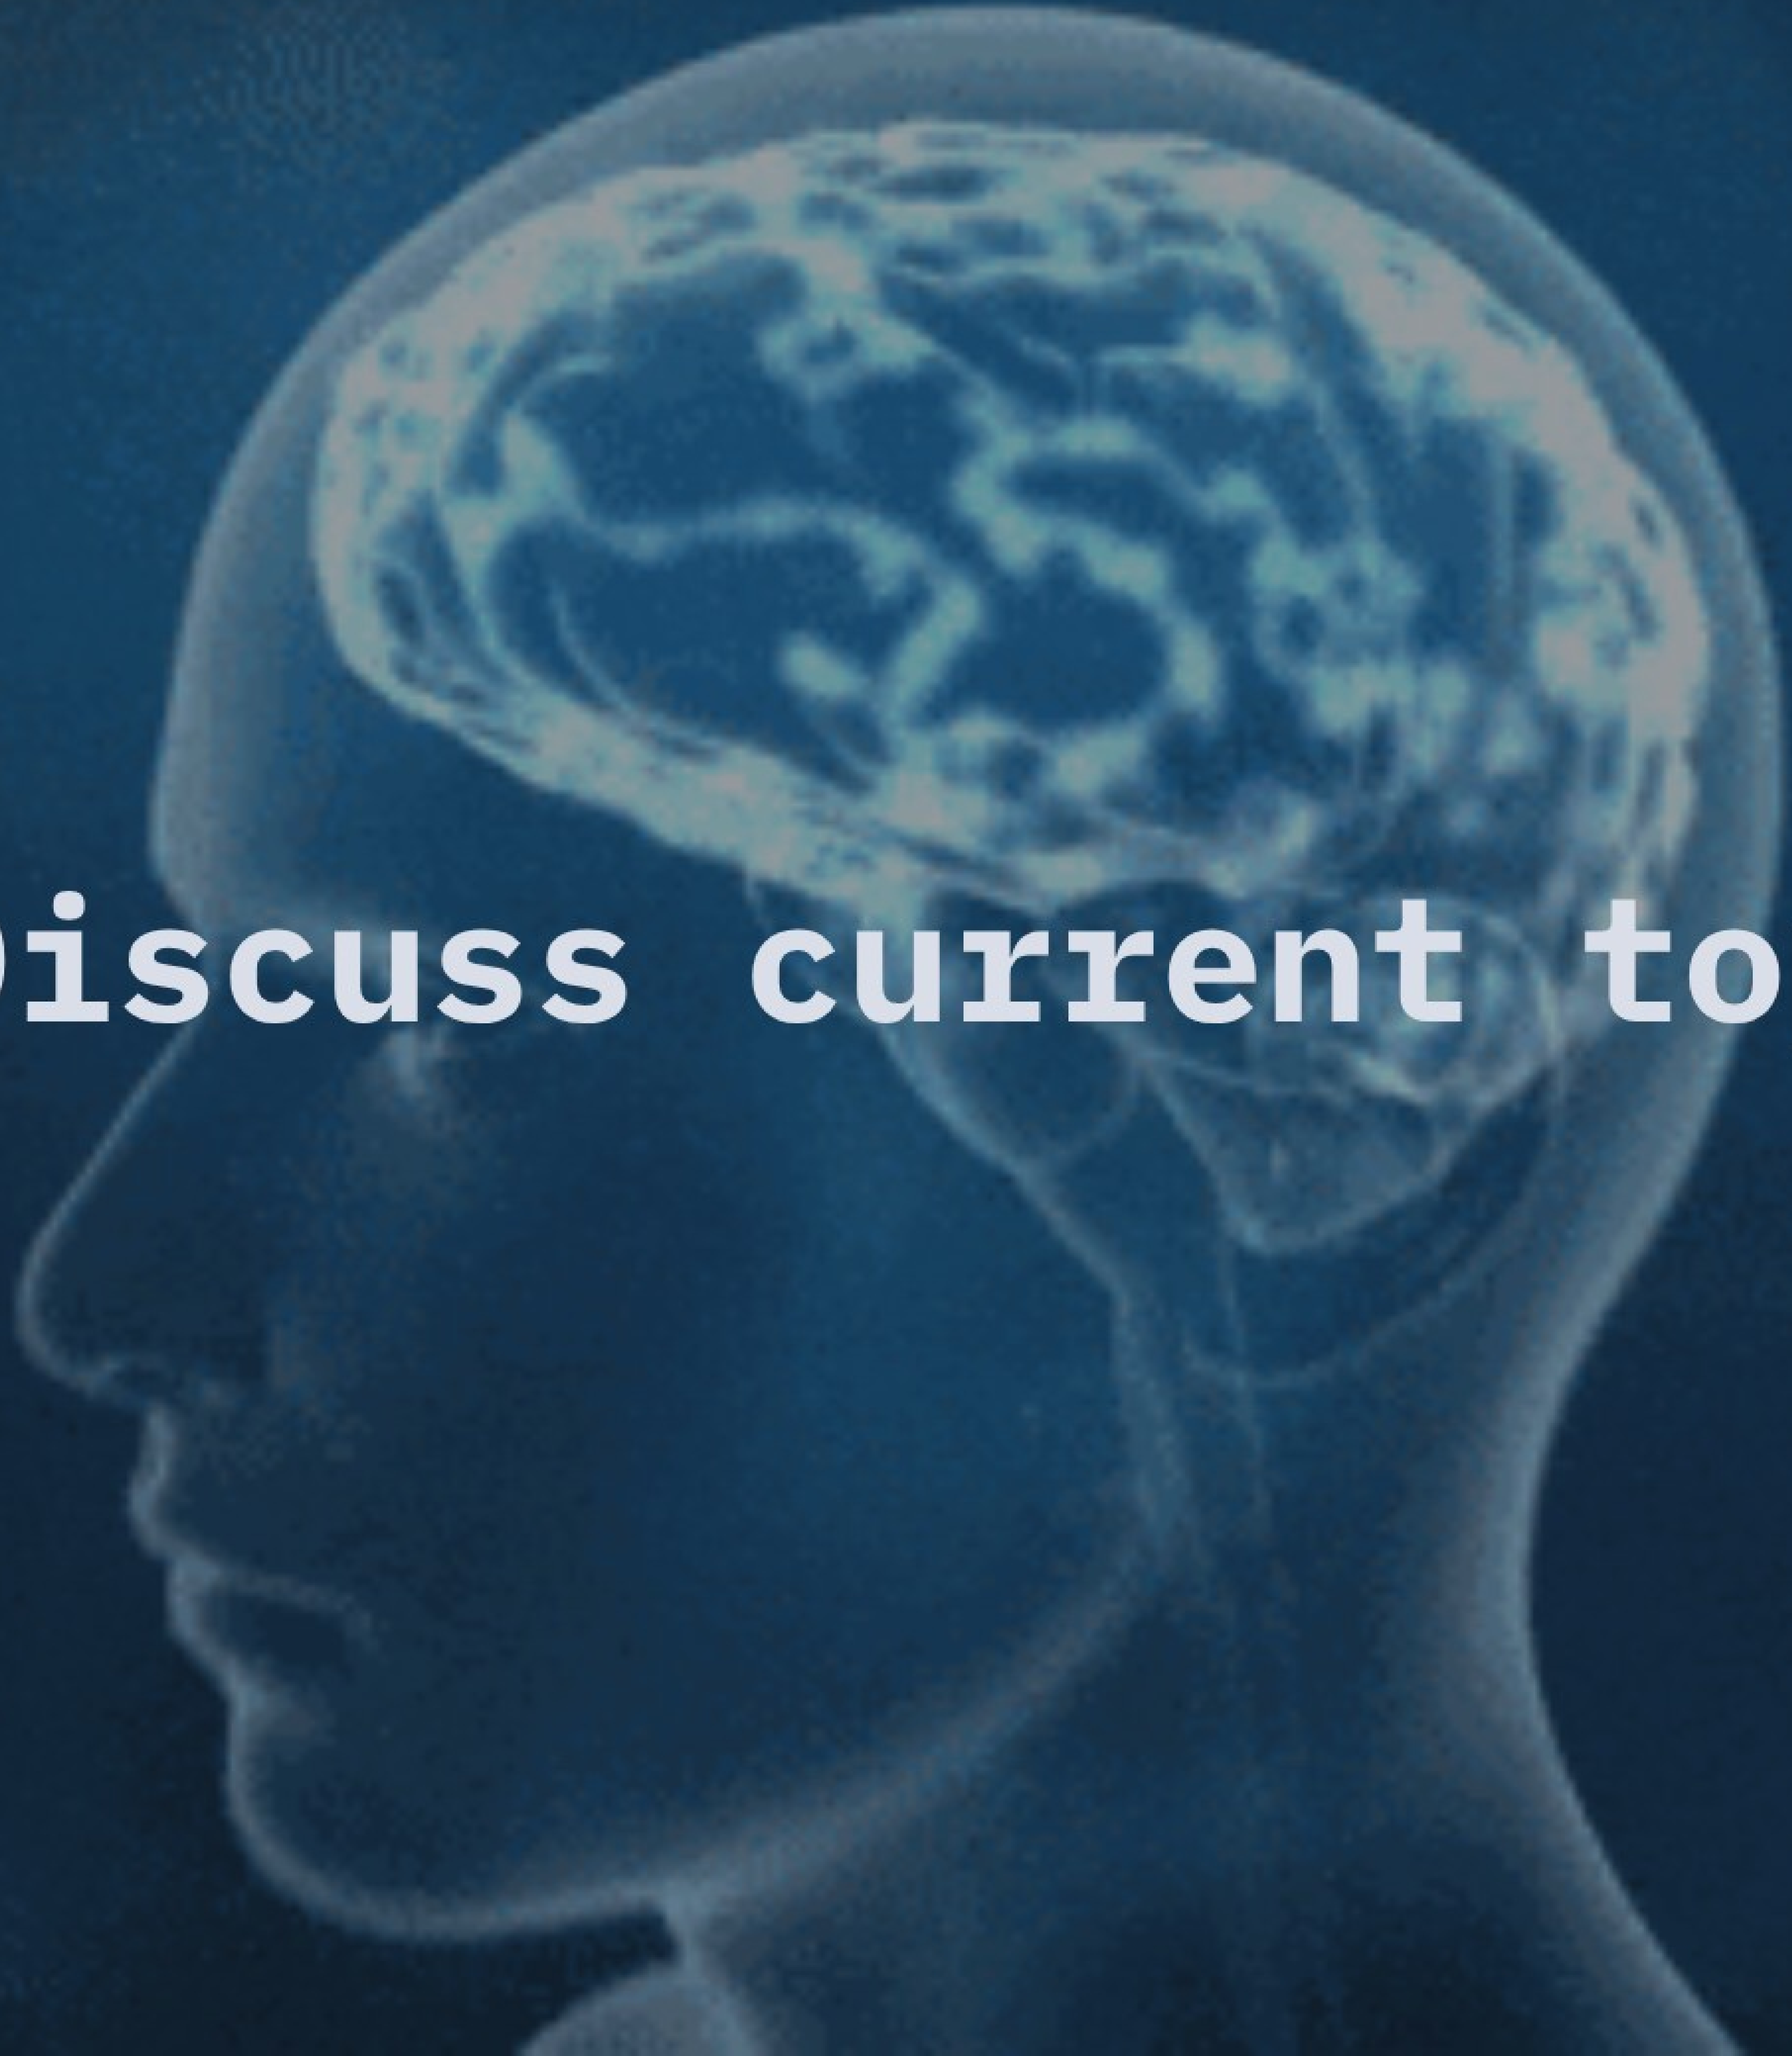

- ☐ 0 a) To add new methods to an object dynamically ☐
- ☒ 3 b) To modify existing behavior of an object dynamically ☒
- ☐ 0 c) To enhance the performance of an application ☐
- ☐ 0 d) None of the above ☐

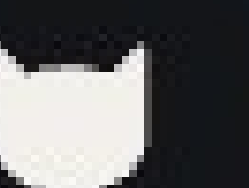

Which of the following scenarios best suits the use of the Bridge design pattern?

- 0 a) When you need to generate multiple versions of a component without affecting its clients. ✗
- 1 b) When the implementation of a component needs to be chosen or switched at runtime. ✓
- 0 c) When you have several classes that differ only in their implementation details. ✗
- 4 d) All of the above. ✗

Discuss current topic

Difference

- Adapter converts an interface into one a client expects.
- Decorator dynamically adds behavior to objects.
- Proxy controls access to an object.
- Bridge decouples an abstraction from its implementation, allowing them to vary independently.
- All are structural design patterns in object-oriented programming, aimed at improving code scalability, flexibility, and

Coding Is A Left-brain Activity

Have you looked through the materials?

Advanced Patterns: Chain of Responsibility

Chain Of Responsibility Design Pattern

Descriptive real-world example

Rules \ Principles

- Each processor in the chain will have its implementation for processing a command
- Every processor in the chain should have reference to the next processor
- Each processor is responsible for delegating to the next processor so beware of dropped commands
- Processors should not form a recursive cycle
- Only one processor in the chain handles a given command

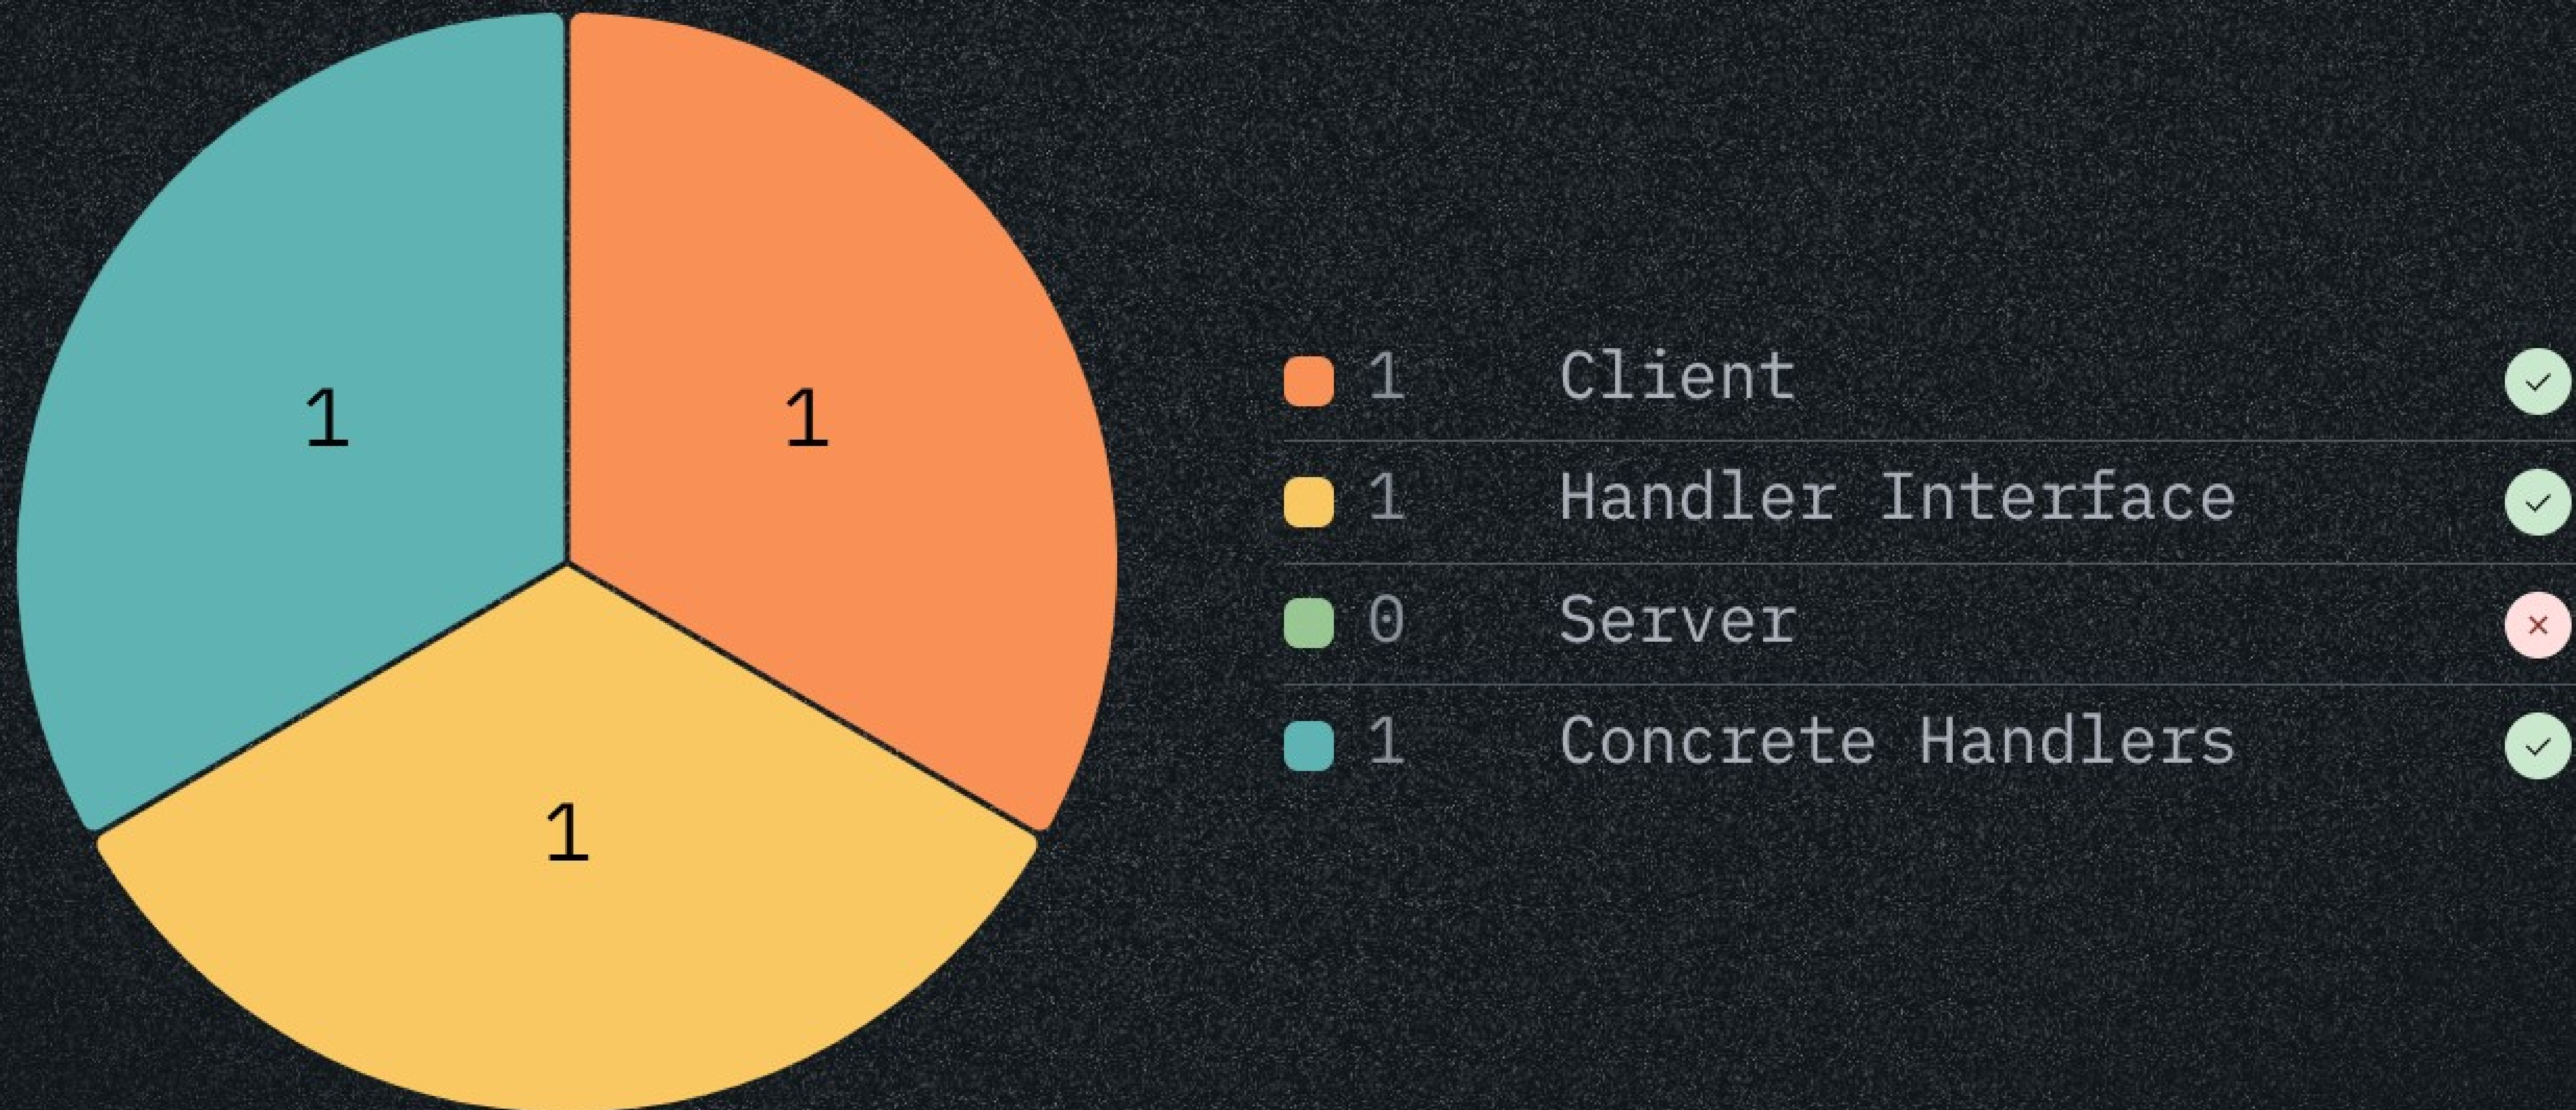

Benefits

- Decoupling of Sender and Receiver
- Flexibility in Assigning Responsibilities
- Enhanced Scalability
- Promotion of the Single Responsibility Principle
- Dynamic Reconfiguration
- Improved Maintainability

Disadvantages

1. Mostly, it can get broken easily:
 - a. if a processor fails to call the next processor, the command gets dropped
 - b. if a processor calls the wrong processor, it can lead to a cycle
2. It can create deep stack traces, which can affect performance
3. It can lead to duplicate code across processors, increasing maintenance

What are the key components of the chain of responsibility pattern?

Select all usage scenarios in which Chain of Responsibility can be particularly beneficial:

What does the Chain of Responsibility design pattern primarily help achieve in software design?

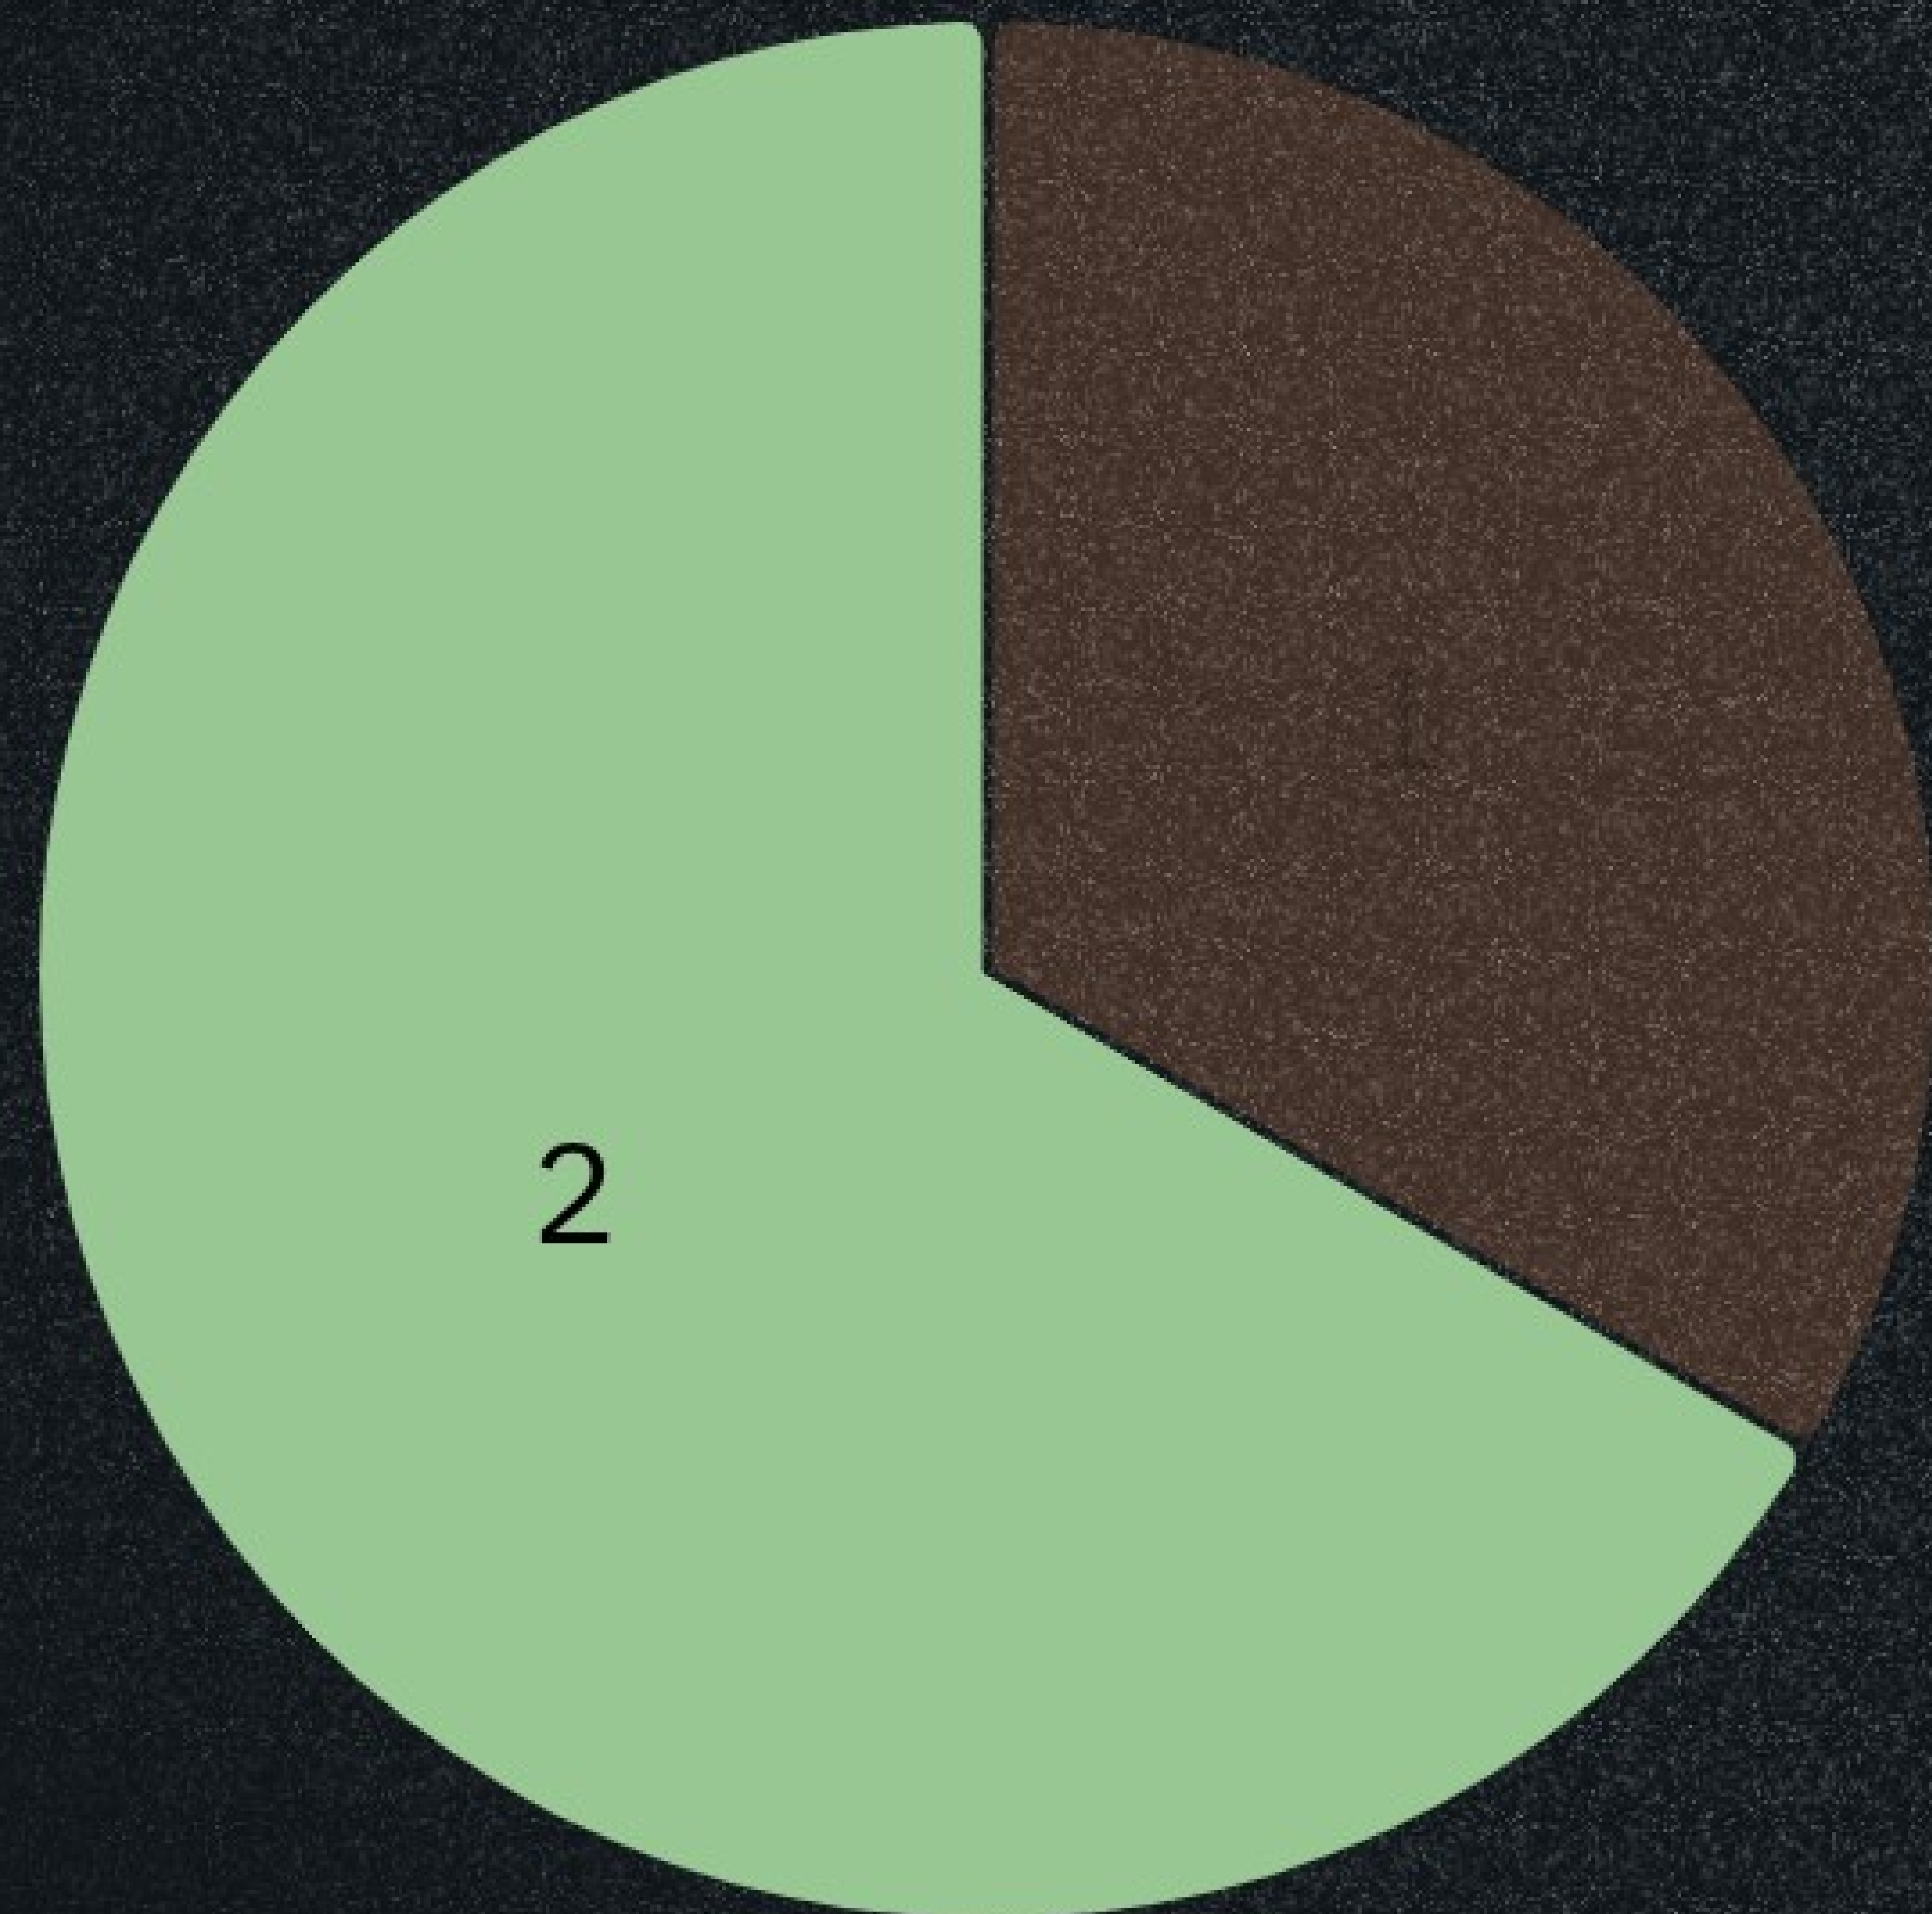

- | | | |
|---|---|---|
| 0 | A) Encapsulation of method invocations. | ✗ |
| 0 | B) Mutual coupling of classes. | ✗ |
| 3 | C) Decoupling of senders and receivers by giving multiple objects an opportunity to handle a request. | ✓ |
| 0 | D) Creation of object clones. | ✗ |

In the Chain of Responsibility, if an object can handle a request, what should it do next?

- 0 A) Pass the request to all successor handlers irrespective of its own ability to handle it. ✗
- 2 B) Handle the request and decide whether to pass it to the next handler in the chain. ✓
- 0 C) Modify the request and send it back to the sender. ✗
- 0 D) Terminate the program. ✗

Which of the following scenarios is most suitable for using the Chain of Responsibility pattern?

- 1 A) When exactly one object must handle a specific type of request. ✗
- 0 B) When operations need to be carried out in a strict sequence. ✗
- 2 C) When multiple objects can handle a request, and the handler doesn't have to be a specific object. ✓
- 0 D) When operations are highly dependent on the type of data and specific algorithms. ✗

Quiz

When is Chain of Responsibility useful?

What does the Chain of Responsibility pattern achieve?

8 ✓

0 ✗

Direct method calls

0 ✗

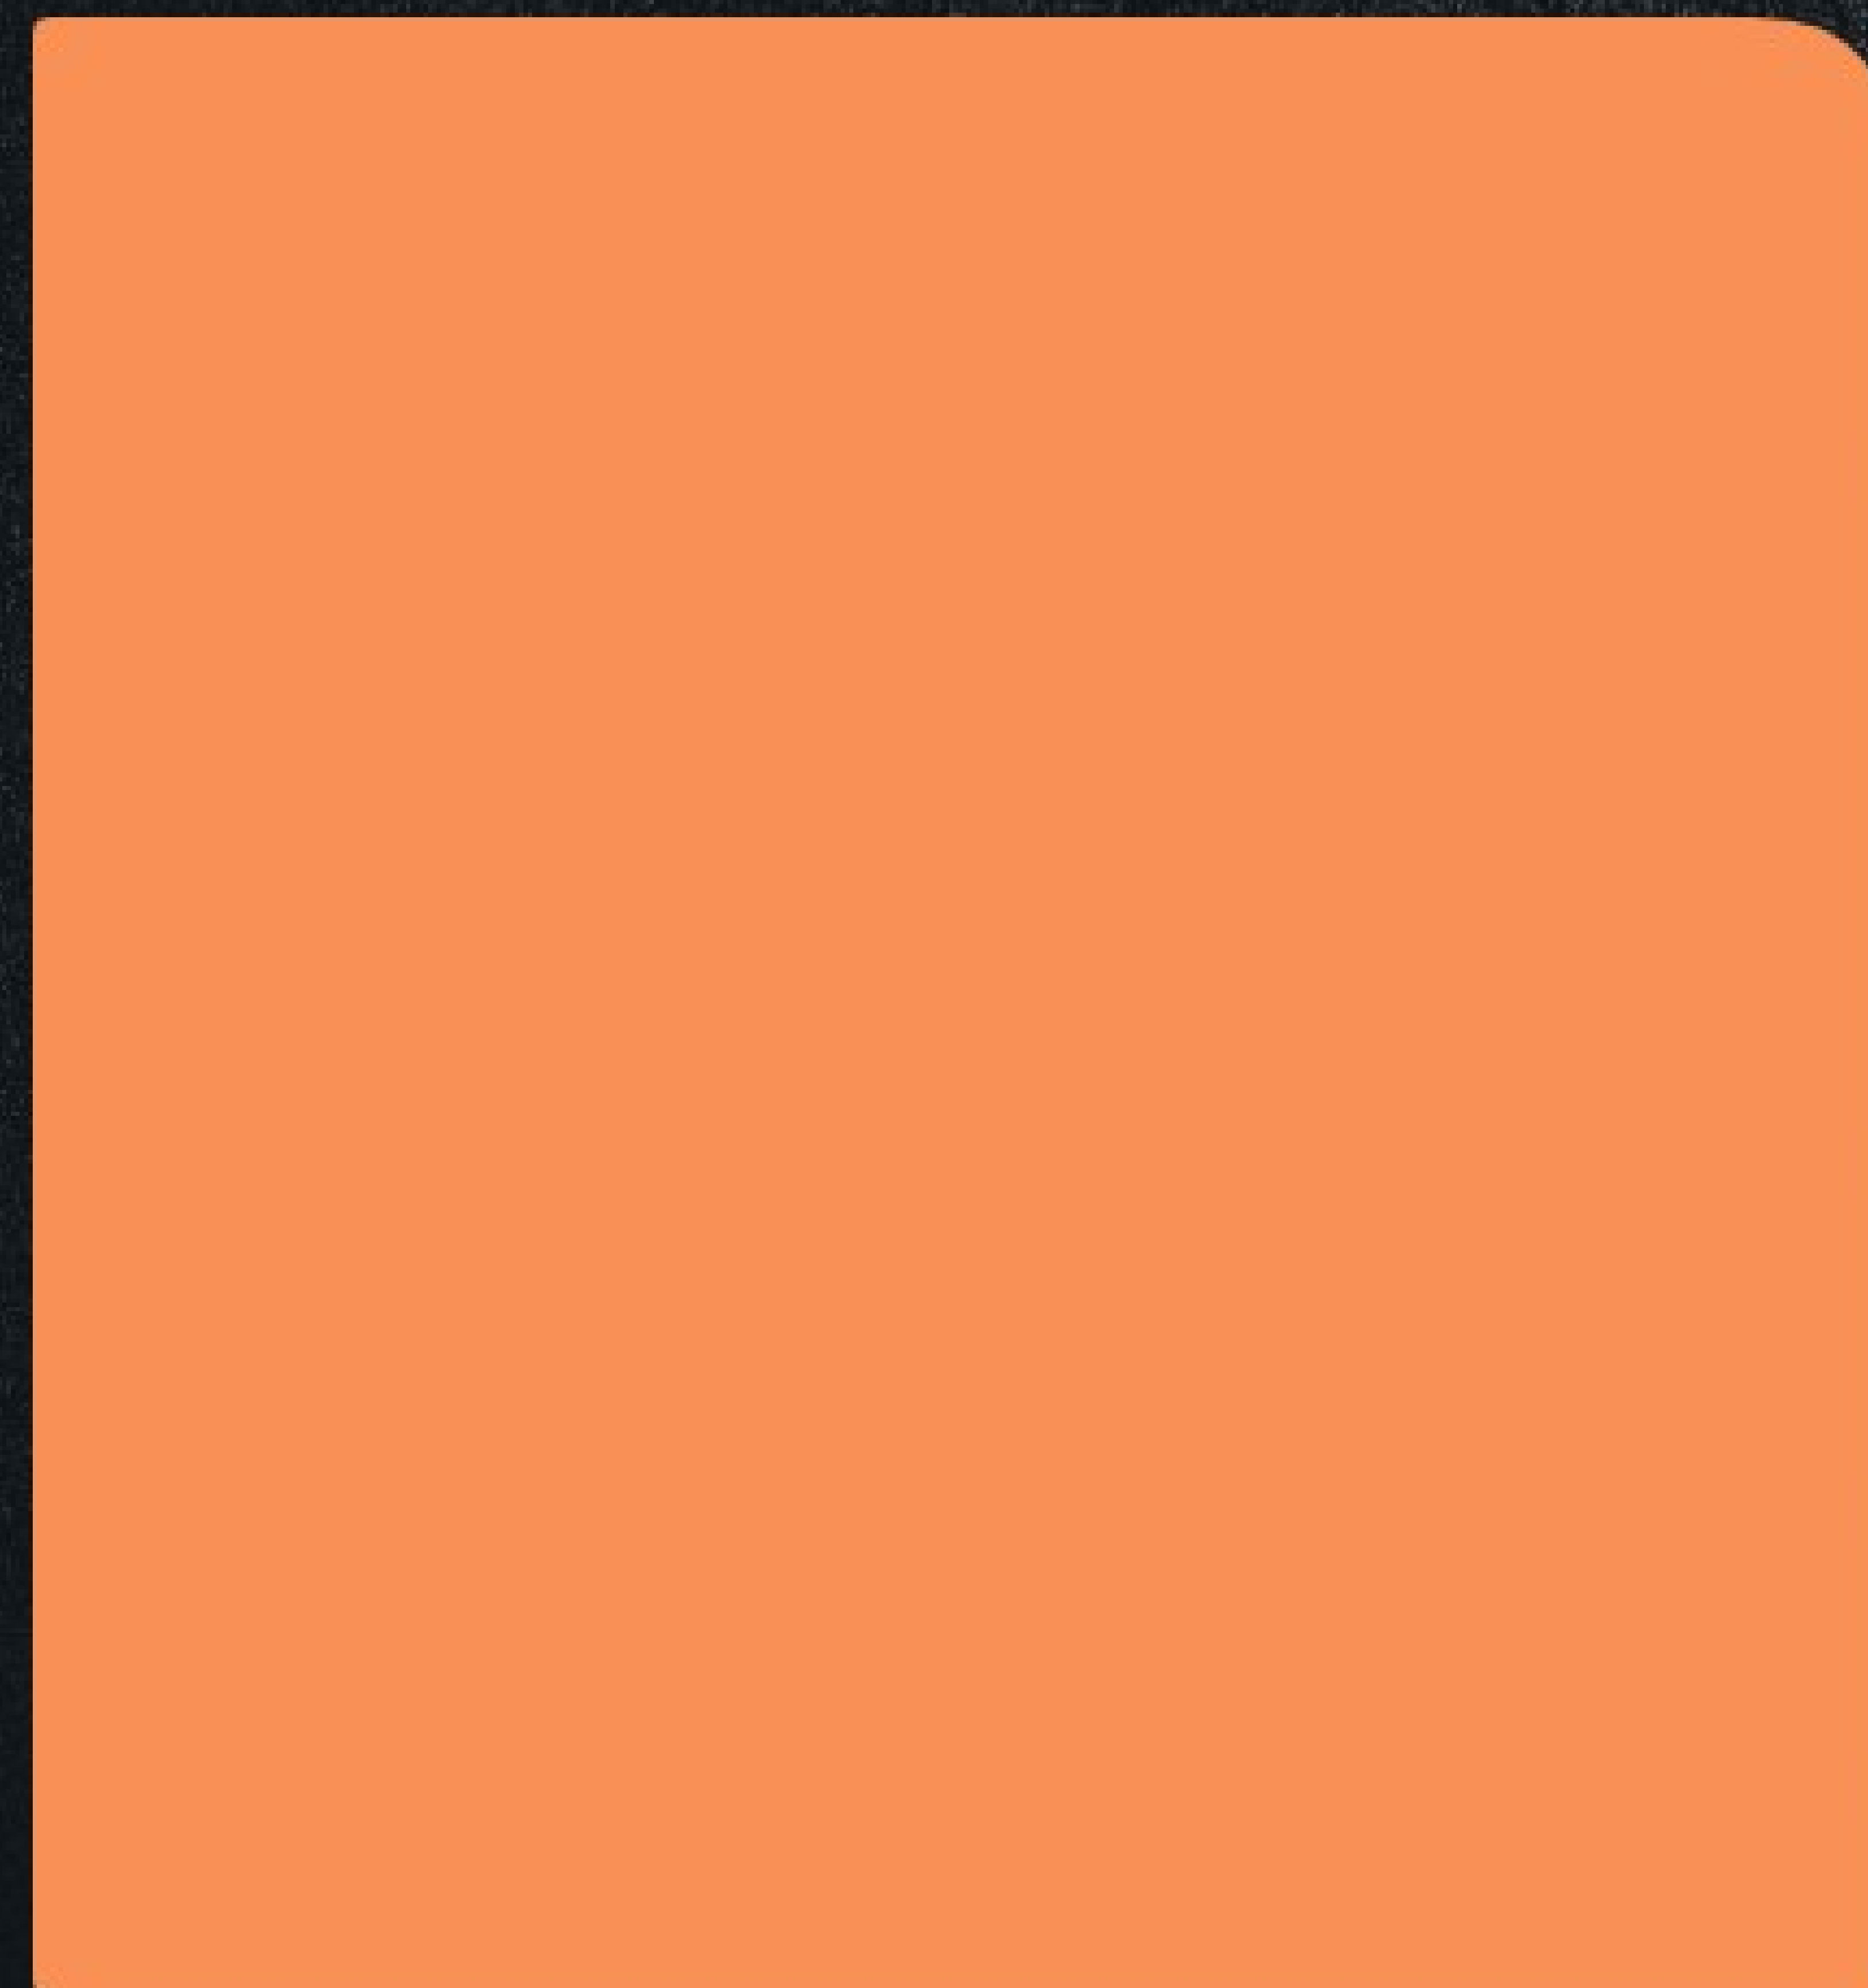

Implements global
variables

0 ✗

Optimizes object creation

How does Chain of Responsibility improve flexibility?

7 ✓

Decouples request sender
from receivers

1 ✗

Reduces method calls

0 ✗

Simplifies algorithm
execution

0 ✗

Enforces multi-threading

What happens if no handler processes a request?

0 ✖

Request is logged globally

0 ✖

Request is ignored

8 ✔

Request is discarded or default action occurs

0 ✖

Throws a runtime exception

In Chain of Responsibility, handlers are connected as?

Which principle does Chain of Responsibility follow?

What is a benefit of Chain of Responsibility?

8 ✓

Allows dynamic processing sequences

0 ✗

Integrates global states

0 ✗

Optimizes execution speed

0 ✗

Provides static method calls

Example: What is a real-world analogy for this pattern?

0 ✖

Static list for object
creation

0 ✖

Abstract class
middleware

8 ✔

Customer service
escalation process

0 ✖

Database initialization

How can the chain be terminated?

0 

Static calls to methods

0 

Global variable
invocation

0 

Direct callback

8 

By not forwarding the
request

What is the last handler in a chain called?
